

# PERFORMANCE REPORT

## CS-PFR-15-4 Augean North Sea Services tested with challenging Extended Reach High Pressure / High Temperature 16" section

After the successful provision of the offshore containment of drill cuttings in our first two wells (SW09s1 & SW01s1) with Shell, Shells performance expectations were again understandably high for Augean North Sea Services (ANSS).

This was based on containing 3258ft of 16" hole section in 24hrs and handling rates of penetration (RoP) for sustained periods of between 300-400 ft/hr on-board the Noble Hans Deul.

With a crew of 6 men (3 per shift) n the third well for Shell, ANSS safely and successfully contained OBM drill cuttings during the 16" section on-board the Noble Hans Deul utilising an 8-bay skip load station and once again delivered excellent performance.

The drilling programme dictated that controlled drilling parameter's would come into effect for certain formations during the 11,00ftof the 16" section, as this was an Extended Reach drilling well. Given the long and sustained periods of this section when the RoP was restricted to 300ft/hr, this was a real test of endurance and reliability for the ANSS crew and equipment. Both passed this test with

flying colours as they operated efficiently without any Non-productive time for the entire section.

This was viewed by Shell as excellent performance during SW06s1 for OBM containment during 16" hole section drilling. ANSS are very proud of our offshore team's performance.
